EK-Quantum
Vector Strix RTX 3070
GPU WATER BLOCK
Before you start using this product, please follow these basic guidelines:

Carefully read the manual before beginning with the installation process.

Remove your graphics card from the computer for the safest mounting process to prevent any possible damage to your GPU or its circuit board (PCB).

EK Fittings require only a small amount of force to screw them firmly in place since the liquid seal is ensured with the rubber O-ring gaskets.

The use of quality market-proven corrosion-inhibiting coolants is always strongly recommended for any liquid cooling system.

Do not use pure distilled water as a cooling liquid! For best results, EK recommends the use of EK-CryoFuel Coolants.

Make sure to bleed air out of your water block thoroughly to reach optimal performance.

</table>
**REQUIRED TOOLS**

- Phillips Head Screwdriver
- Torx T6 Screwdriver
- Scissors

**WATER BLOCK DIMENSIONS**

- 293 mm
- 129 mm
- 154 mm
- 142 mm
- 16.4 mm
- 14.6 mm
TECHNICAL SPECIFICATIONS AND MAIN WATER BLOCK PARTS

**Technical Specification:**
- Dimensions (LxHxW): 293 x 154 x 16.4 mm
- D-RGB (Addressable RGB) Cable - Length: 500 mm
- D-RGB LED Count: 12
- D-RGB Connector: Standard 3-Pin (+5V, Data, Blocked, Ground)
PREPARING THE GRAPHICS CARD

STEP 1
REMOVING THE STOCK COOLER
Use the Phillips head screwdriver to remove the three screws from the GPU bracket side and six screws from the side of the backplate.

After removing all nine screws (marked in the picture), carefully detach the PCB with the backplate from the stock cooler and disconnect two cables connected to the PCB.

Always remove the stock cooler slowly - it might be firmly glued to the PCB with thermal pads.

For this Step, you will need:
- Phillips Head Screwdriver
- Torx T6 Screwdriver
STEP 2
REMOVING THE STOCK BACKPLATE
Use the Phillips head screwdriver to remove the two screws attaching the GeForce® RTX™ plate to the backplate.

Remove the nine screws with Phillips and Torx head screwdrivers and carefully detach the stock backplate from the PCB.
STEP 1

Your GPU water block comes with thermal pads that have to be cut into smaller pieces to cover all the VRM components, such as COILs, MOSFETs, and drivers.

You must remove the protective foil from both sides of the thermal pad before installation.

Thermal pads: 5x Thermal Pad F 1.0 mm – (120 x 16 mm) EAN: 3830046996732

STEP 3

CLEANING THE PCB

Wipe off the remains of the original thermal compound using a nonabrasive cloth or Q-tip, as shown in the sample image, until the components and circuit board are completely clean. EK recommends the use of denatured alcohol for removing TIM leftovers. After that, remove all remaining stock thermal pads from the PCB.

CUTTING AND PLACING THERMAL PADS
**STEP 1**

Apply the enclosed EK-TIM Ectotherm thermal grease (thermal compound) on the CPU heat spreader – IHS – as shown in the image. The layer of the thermal compound must be thin and even over the entire surface of the IHS.

The excessive or uneven application of thermal grease may lead to poor performance!

**STEP 2**

Once cut to size, thermal pads should be placed on the PCB, as illustrated in the image. EK made sure to provide you with more than an adequate quantity of thermal pads to complete this Step.
**INSTALLED THE WATER BLOCK**

This procedure is the same for all full-cover water blocks.

**STEP 1**
**PLACING THE BLOCK ON THE GRAPHICS CARD**

Carefully position the water block with preinstalled standoffs on the graphics card. During this process, make sure you have aligned mounting holes of the PCB with holes of the water block (same applies to other tops).

Pay attention not to use too much force when pressing the block down to the PCB since chip dies are prone to cracking.

**STEP 2**
**ATTACHING THE BLOCK TO THE GRAPHICS CARD**

Use thirteen (13) M2.5 X 4 AX1 screws and M2.5 PVC washers. Tighten the screws evenly using the Phillips head screwdriver. EK recommends you start tightening the screws around the GPU core first and then continuing outward to prevent damaging the GPU. Always use a plastic washer under each screw!

For this Step, you will need:

- **M2.5 x 4 AX1**
  - 13 pcs
- **M2.5 PVC Washer**
  - 13 pcs
- **Phillips Head Screwdriver**
CHECKING FOR CONTACT

If necessary, temporarily remove the water block to check for uniform surface contact between the block and components. Pay special attention to the VRM section of the graphics card. Check whether the water block makes contact with the intended integrated circuit. Then repeat Steps from the previous section to re-attach the block.

⚠️ In case you fail to obtain good contact, please check again or contact our support service at https://www.ekwb.com/customer-support/.

INSERTING THE GRAPHICS CARD INTO THE CHASSIS

Carefully lift your graphics card with the installed water block and insert it into your PC’s motherboard PClexpress expansion slot. Please keep in mind that your graphics card is heavier than before it was equipped with the water block.

⚠️ You need to be very careful when handling the graphics card. Avoid all unnecessary manipulation of the water block assembly that might damage your card or water block.
**INSTALLATION OF FITTINGS AND TUBING**

**STEP 1**
Screw-in two (2) G1/4 threaded male fittings. Attach the liquid cooling tubes and connect the water block to the cooling loop.

Do not forget to plug the remaining two openings with enclosed EK-Plug G1/4 or its equivalent.

EK recommends using EK fittings with all EK water blocks.

**CAUTION:** When using connectors other than EK fittings, pay special attention to the length of the fittings’ male G1/4” thread – 5mm is the maximum G1/4” thread length allowed!

**CONNECTING THE D-RGB LED STRIP**

**STEP 1**
Plug the 4-pin D-RGB connector from the GPU water block to the D-RGB Header on your motherboard or controller. The LED strip will work only if the pin layout on the header is as follows: **+5V, Data, Empty, Ground**.

Incorrect installation or installation to a wrong header can damage to the LED strip or the header itself!
To ensure the installation of EK components was successful, we recommend you perform a 24-hour leak test.

When your loop is complete and filled with coolant, connect the pump to a PSU outside your system. Do not connect power to any of the other components. Turn on the PSU and let the pump run continuously.

Inspect all parts of the loop, and in case the coolant leaks, fix the issue and repeat the testing process. To prevent possible damage, please ensure that all hardware is dry before the system is powered on.

**TESTING THE LOOP**

**STEP 1**
If you want to replace the D-RGB LED strip, you must remove the three (3) standoffs shown in the picture using a 6mm wrench. Remove the stickout and replace the LED strip.

Once you have replaced the LED strip, align the holes on the stickout with holes on the top plate, and tighten the standoffs evenly.

**REPLACING THE LED STRIP (Optional)**

**STEP 1**

M4/M2.5 x 2.50 (LONGER) STANDOFF
